

Cheatsheet: Python Coding Practices and Packaging Concepts

Estimated time needed: 5 minutes

Package/Method	Description	Code Example
Packaging	To create a package, the folder structure is as follows:	module1.py
	1. Project folder → Package name → init.py , module_1.py , module_2.py , and so on.	<pre>def function_1(arg): return <operation output></pre>
Python Style Guide	2. In the init.py file, add code to reference the modules in the package.	init.py:
	<ul style="list-style-type: none"> Four spaces for indentation Use blank lines to separate functions and classes Use spaces around operators and after commas Add larger blocks of code inside functions Name functions and files using lowercase with underscores Name classes using CamelCase Name constants in capital letters with underscores separating words 	<pre>from . import function_1 def function_1(a, b): if a > b: c = c + 5 else: c = c - 3 return c ... c = function_1(a, b)</pre>
Static Code Analysis	Use Static code analysis method to evaluate your code against a predefined style and standard without executing the code.	Constant Definition example
Unit Testing	For example, use Pylint to perform static code analysis.	MAX_FILE_UPLOAD_SIZE
	Unit testing is a method to validate if units of code are operating as designed.	Shell code:

```
pylint code.py
```

```
import unittest
```

Package/Method	Description	Code Example
	During code development, each unit is tested. The unit is tested in a continuous integration/continuous delivery test server environment.	<pre>from mypackage.mymodule import my_function</pre>
	You can use different test functions to build unit tests and review the unit test output to determine if the test passed or failed.	<pre>class TestMyFunction(unittest.TestCase): def test_my_function(self): result = my_function(<args> self.assertEqual(result, <response>) unittest.main()</pre>
