Cheat Sheet: API's and Data Collection

```
Package/Method Description
                                                                                                          Code Example
                              Syntax:
                                 1. 1
                                 1. attribute = element[(attribute)]
                Access the
                value of a
                               Copied!
Accessing
                specific
element attribute
                attribute of an
                              Example:
                HTML
                element.
                                 1. 1
                                 1. href = link_element[(href)]
                               Copied!
                              Syntax:
                                 1. 1
                Parse the
                HTML content
                                1. soup = BeautifulSoup(html, (html.parser))
                of a web page
                using
                               Copied!
                BeautifulSoup.
BeautifulSoup()
                              Example:
                The parser
                type can vary
                                 1. 1
                based on the
                project.
                                 1. html = (https://api.example.com/data) soup = BeautifulSoup(html, (html.parser))
                               Copied!
                              Syntax:
                Send a
                DELETE
                request to
                                 1. response = requests.delete(url)
                remove data or
                a resource
                               Copied!
                from the
delete()
                server.
                              Example:
                DELETE
                requests delete
                a specified
                                 1. response = requests.delete((https://api.example.com/delete))
                resource on
                the server.
                               Copied!
                              Syntax:
                                 1. 1

    element = soup.find(tag, attrs)

                Find the first
                HTML
                               Copied!
                element that
find()
                matches the
                              Example:
                specified tag
                and attributes.
                                 1. first_link = soup.find((a), {(class): (link)})
                               Copied!
                              Syntax:
                                 1. 1
                                 1. elements = soup.find_all(tag, attrs)
                Find all
                HTML
                               Copied!
                elements that
find_all()
                match the
                              Example:
                specified tag
                and attributes.
                                 1. 1
                                 1. all_links = soup.find_all((a), {(class): (link)})
                               Copied!
findChildren()
                Find all child
                elements of an
                HTML
                element.
                                 1. children = element.findChildren()
                               Copied!
                              Example:
```

about:blank 1/4

6/28/24, 6:24 AM about:blank

```
1. 1
                                 1. child_elements = parent_div.findChildren()
                                Copied!
                 Perform a
                 GET request
                 to retrieve data
                               Syntax:
                 from a
                 specified
                                 1. 1
                 ÛRL. GET
                 requests are
                                 1. response = requests.get(url)
                 typically used
                               Copied!
                 for reading
get()
                 data from an
                               Example:
                 API. The
                 response
                                 1. 1
                 variable will
                 contain the
                                 1. response = requests.get((https://api.example.com/data))
                 server's
                response,
                                Copied!
                 which you can
                 process
                 further.
                               Syntax:
                 Include
                 custom
                                 1. 1
                headers in the
                                 1. headers = { (HeaderName): (Value) }
                 request.
                 Headers can
                               Copied!
                provide
Headers
                 additional
                 information to Example:
                the server,
                                 1. 1
                 such as
                 authentication
                                 1. base_url = (https://api.example.com/data) headers = {(Authorization): (Bearer YOUR_TOKEN)} response = reques
                 tokens or
                               Copied!
                content types.
                               Syntax:
                Import the
                necessary
                                 1. 1
Import Libraries
                Python
                                 1. from bs4 import BeautifulSoup
                 libraries for
                 web scraping.
                               Copied!
                 Parse JSON
                 data from the
                               Syntax:
                 response. This
                 extracts and
                 works with the
                                 1. data = response.json()
                 data returned
                 by the API.
                               Copied!
                 The
                 response.json() Example:
json()
                 method
                 converts the
                 JSON
                 response into a
                                 1. response = requests.get((https://api.example.com/data))
                 Python data
                                 2. data = response.json()
                 structure
                 (usually a
                                Copied!
                 dictionary or
                list).
                               Syntax:
                                 1. 1
                                 1. sibling = element.find_next_sibling()
                Find the next
                               Copied!
                 sibling
next_sibling()
                 element in the Example:
                 DOM.
                                 1. next_sibling = current_element.find_next_sibling()
                               Copied!
                 Access the
parent
                               Syntax:
                 parent element
                                 1. 1
                 in the
                 Document
                                 1. parent = element.parent
                 Object Model
                 (DOM).
                               Copied!
```

about:blank 2/4

```
Example:
                                 1. 1
                                 1. parent_div = paragraph.parent
                               Copied!
                Send a POST
                               Syntax:
                request to a
                 specified URL
                 with data.
                 Create or
                                 1. response = requests.post(url, data)
                 update POST
                requests using Copied!
post()
                resources on
                the server. The Example:
                data parameter
                contains the
                data to send to
                                 1. response = requests.post((https://api.example.com/submit), data={(key): (value)})
                the server,
                often in JSON Copied!
                format.
                Send a PUT
                request to
                               Syntax:
                update data on
                                 1. 1
                the server.
                PUT requests
                                 1. response = requests.put(url, data)
                are used to
                update an
                               Copied!
                 existing
put()
                resource on
                               Example:
                the server with
                the data
                provided in the
                                 1. response = requests.put((https://api.example.com/update), data={(key): (value)})
                data
                parameter,
                               Copied!
                typically in
                JSON format.
                               Syntax:
                Pass query
                                 1. params = { (param_name): (value) }
                parameters in
                the URL to
                               Copied!
                filter or
                customize the Example:
Query parameters request. Query
                parameters
                                 2. 2
                 specify
                                 3. 3
                conditions or
                limits for the
                                 1. base_url = "https://api.example.com/data"
                requested data.
                                 2. params = {"page": 1, "per_page": 10}
                                 3. response = requests.get(base_url, params=params)
                               Copied!
                               Syntax:
                                 1. 1
                                 1. element = soup.select(selector)
                 Select HTML
                elements from Copied!
select()
                the parsed
                HTML using a Example:
                CSS selector.
                                 1. titles = soup.select((h1))
                               Copied!
status_code
                 Check the
                               Syntax:
                HTTP status
                                 1. 1
                code of the
                 response. The
                                 1. response.status_code
                 HTTP status
                code indicates Copied!
                the result of
                the request
                               Example:
                (success, error,
                                 1. 1
                redirection).
                                 2. 2
                 Use the HTTP
                                 3. 3
                 status codeIt
```

```
1. url = "https://api.example.com/data"
                                                  can be used for
                                                                                                   2. response = requests.get(url)
